## **Fetching Argo data**

API

Import the data fetcher, select an access point (region, float or profile) and trigger data or index download:

### A basic example

### User modes

API

**argopy** provides 3 user modes with different level of data post-processing:

- **processing** expert mode: return all the Argo data, without any post-processing.
- **standard** mode: simplifies the dataset, remove most of its jargon and return a priori good data, namely: QC=[1,2] & DM=[R,D,A]. This is the default mode.
- research mode: simplifies the dataset to its heart, preserving only data of the highest quality for research studies, including studies sensitive to small pressure and salinity bias (e.g. calculations of global ocean heat content or mixed layer depth), namely: QC=1 & DM=D.

#### **Full session**

```
import argopy
argopy.set_options(mode='expert')
```

### **Temporary context**

```
with argopy.set_options(mode='expert'):
   DataFetcher().profile(6902746, 34)
```

### **Fetcher option**

```
DataFetcher (mode='research').region([-75, -45, 20, 30, 0, 100])
```

### **Data manipulation**

API

Use methods from the argo xarray accessor

#### **Transformation**

```
# Points vs profiles
```

```
ds.argo.point2profile()
ds.argo.profile2point()
```

### # Interpolation (pressure levels)

```
std = [0,100,200,500] # in db
ds.argo.interp std levels(std)
```

#### # Group-by pressure bins

#### **Filters**

#### # QC flags

#### # Data modes

```
ds.argo.filter data mode()
```

#### # OWC variables

ds.argo.filter scalib pres(force='default')

#### **Additional variables**

Complete your dataset with additional variables using the TEOS-10

```
ds.argo.teos10(['SA', 'CT', 'CNDC'])
```

#### Dataset

API

**argopy** provides 2 data sources for physical ("phy") and biogeochemical ("bgc") parameters

#### Data sources

API

argopy allows users to fetch Argo data from several sources:

- the Ifremer erddap. Updated daily, this database holds the complete dataset and is efficient for large requests
- a **GDAC server**. This could be one of the 2 ftps or the Ifremer http
- your local data copy of the GDAC. Useful to work offline.
- the **Argovis** server. Updated daily, provides access to QC=1 data only

### Argo meta data

API

### Index of profiles

Based on GDAC servers or local file, support: core, synthetic and bio profiles index

```
from argopy import ArgoIndex
ArgoIndex().N_RECORDS
ArgoIndex().to_dataframe()
ArgoIndex().search_lat_lon([-60, -55, 40, 45])
ArgoIndex().search_wmo([1901393, 6902755])
```

#### For a more user-friendly API, you can use the index fetcher:

```
from argopy import IndexFetcher
fetcher=IndexFetcher().region([-75, -45, 20, 30])
fetcher.to_xarray()
fetcher.to_dataframe()
fetcher.index
```

#### Reference tables

Based on NERC Vocabulary Server (NVS) managed by the Argo Vocabulary Task Team (AVTT)

```
from argopy import ArgoNVSReferenceTables
ArgoNVSReferenceTables().tbl_name('R01')
ArgoNVSReferenceTables().tbl('R01')
ArgoNVSReferenceTables().all_tbl_name
ArgoNVSReferenceTables().all_tbl
ArgoNVSReferenceTables().search('sensor')
```

#### **Deployment plan**

Based on Ocean-OPS API, retrieve past and future plans

#### **ADMT Documentation**

```
from argopy import ArgoDocs
ArgoDocs().list
ArgoDocs(35385)
ArgoDocs(35385).open_pdf(page=12)
ArgoDocs().search('CDOM')
```

### Full session

#### Temporary context

```
with argopy.set_options(src='argovis'):
  DataFetcher().profile(6902746, 34)
```

#### **Fetcher option**

```
DataFetcher(src='erddap')
```

### From a Data or Index fetcher

```
from argopy import DataFetcher, IndexFetcher
fetcher = DataFetcher() # or IndexFetcher()
fetcher.region([-75, -45, 20, 30, 0, 100,
                '2015-01', '2020-01']).load()
```

### **Trajectories**

fetcher.plot()

fetcher.plot('trajectory')

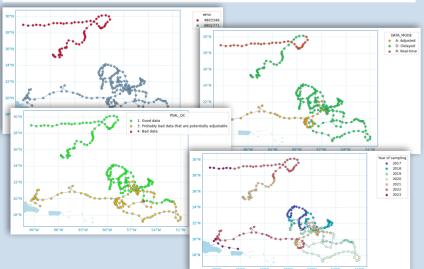

### Histograms on properties

fetcher.plot('dac') fetcher.plot('profiler')

### **Scatter maps from Datasets**

```
from argopy.plot import scatter map
scatter map(ds)
scatter map(ds, hue='DATA MODE')
scatter map(ds.isel(N LEVELS=0), hue='PSAL QC')
ds['year'] = ds['TIME.year'] # Add a variable
scatter_map(ds.isel(N LEVELS=0),
            hue='vear',
            cmap='Spectral r',
            legend title='Year of sampling')
```

#### **Dashboards**

For a collection of floats or profiles, get an easy and direct access to Euro-Argo, BGC, Ocean-Ops, Coriolis and Argovis dashboards

#### From a fetcher

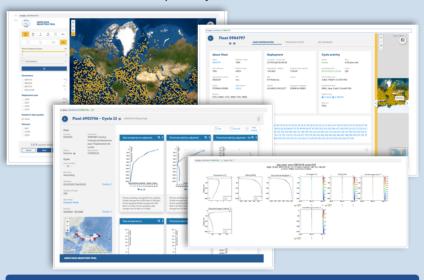

DataFetcher().float(6902746).dashboard()

#### or direct access

from argopy import dashboard dashboard() dashboard(6902746)

dashboard(6902746, 12) dashboard(5903248, 3, type='bgc')

By default, this will insert the dashboard in a notebook cell, but it can also return the url to open in your browser.

### **Argo color palettes**

from argopy.plot import ArgoColors ArgoColors('data mode') ArgoColors('qc flag') ArgoColors('deployment status')

# Data quality control

### **Topography**

Download a regional subset of the GEBCO 15" topography

```
from argopy import TopoFetcher
ds = TopoFetcher([-65, -55, 10, 20],
                 cache=True).to xarray()
```

### **CLS Altimetry tests**

Easily checkout CLS altimetry test figures for one or more floats

```
from argopy import DataFetcher
fetcher.float([6902745,
               69027461)
fetcher.plot('qc altimetry')
```

#### **Data sources for OWC**

Prepare Matlab data source files for the OWC analysis.

```
from argopy import DataFetcher
ds = DataFetcher(mode='expert')
     .float(6902766)
     .load().data
ds.argo.create_float_source('output folder')
```

### Reference data for core

Using the Ifremer erddap, argopy provides access to the core reference dataset from past Argo profiles as well as from shipbased CTD

### Argo reference profiles

```
fetcher = Datafetcher(src='erddap', ds='ref')
fetcher.region([-65, -55, 10, 20,
                0, 50001).load()
ds = fetcher.data
Ship-based reference CTD profiles
from argopy import CTDRefDataFetcher
with argopy.set options(user='jane doe',
                        password='****'):
     fetcher = CTDRefDataFetcher([-65, -55,
                                   10, 20,
                                    0, 50001)
     ref ctd = fetcher.to xarray()
```
